

PTU Automation Overview: A Case Study

Why Visit Blentech's Indiana Automation Hub?

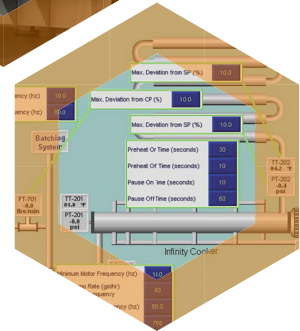

Let's be frank. The automation market can be intimidating. Day after day, developments in software, hardware, network structure, information management let alone cyber security can make even a professional computer scientist feel overwhelmed. With all the complexity already in food production, how can we possibly stay on trend?

While this may all be true, the bottom line is that our manufacturing businesses rely more than ever on the automation systems that drive our production. If they are well designed, we profit. If they are poorly designed, we suffer. As a strategic partner, Blentech has aligned with Rockwell Automation and Endress + Hauser to make the process of scoping an upgrade painless.

A Blentech coordinated PTU visit in Greenwood Indiana, gives our customers that chance to:

- See firsthand, the quality of a Blentech built panel
- Learn about the latest integrations of Rockwell technologies in Blentech equipment solutions
- Scope your project in collaboration with our skilled automation team
- Incorporate the lessons learned from your Blentech Process Audit and or Innovation Center test
- Be confident about the automation you are purchasing

A poorly designed automation and electrical system and eliminate the benefits of even the best built stainless steel equipment. If temperatures aren't controlled, quality suffers. If batching is managed, yield suffers. Of course there are countless examples

A look inside a PTU visit:

A PTU visit is your time well spent. When conducted along with our engineering services, our talented automation team puts demonstration crafted to your Process Flow Concept or system. The demonstration gives you the opportunity to perform a deep dive into our Plant PAX systems, FactoryTalk batch systems, as well as scope a supervisory control system, historian.

Along with these opportunities, our customers get the chance to learn about the latest in Rockwell Automation and Endress + Hauser solutions. Following the demonstration, our teams collaborate to begin the crafting of your Automation Architecture and scope the critical elements of your new system's functional description.
